

Integrating NASA Institutional Management Efforts through Spatial Data Standards FY04

Progress on NASA FY03 Efforts

- Completed addition of all 14 NASA Documents identified in the Statement of Work (NPDs and NPGs)
- Added 4 US Code Sections and 18 Code of Federal Regulation Sections referenced in the basic NASA documents
- Correlated the NASA documents with the appropriate laws and SDS entity sets

Additional documents added

- Researched and entered 18 additional NASA NPDs and NPGs not identified in the Statement of Work
- Added 19 US Code sections and 24 Code of Federal Regulation sections referenced in the additional NASA documents
- Correlated the additional NASA documents with the appropriate laws and SDS entity sets

Additional work

- Correlated all 32 NASA documents with the associated 9 KM business lines
- Began correlating the NASA documents with the CADD/GIS Center Spatial Data Standards at the entity class level (~170 entity classes)

Demonstration

CADD/GIS Center for Facilities,
Infrastructure, and Environment

Real Property Management Home

NASA Policy Documents and related information

Why are these efforts important?

- Consolidated location for NASA institutional management policy documents and laws saves time searching for electronic copies of policies and referenced laws
- Correlation between NASA information and the CADD/GIS spatial data standards supports information sharing and the development of an integrated geospatial approach to institutional management

The SDS provides the framework for data collection and data sharing

- SDS is the ANSI standard data model for geospatial information
- Use of the SDS ensures consistent data collection and naming conventions
- Consistency in data collection and data naming supports efficient and accurate institutional management

Consistency supports efficient institutional management efforts

- Reduced data entry error and redundancy
- Complete data sets collected for all assets
- More accurate searches and reporting
- Reduced geospatial data costs
 - Data can be shared across NASA organizations
 - NASA can better leverage work done by other federal agencies

The SDS establishes the data model for the geospatial database structure

- Data tables
- Data attributes
- Data names
- Relationships among data
- Database hierarchy reflects the SDS hierarchy
 - Entity sets, classes, types
 - Attributes, domains

NASA policy documents are now tied into the SDS structure

- The relationship of NASA policy documents provide the foundation for an integrated approach to real property cost accounting and institutional management through a common operational map.
- Users can track real property assets and liabilities visually and have immediate access to relevant laws as well.

FY04 Recommendations further progress against integration goal

- **Step 1** - Build a relationship between NASA investment categories and the SDS to allow NASA to map and track assets by both established ID and SDS
- **Step 2** - Analyze NASA facilities management data sets and sources against the SDS to ensure the standard is adequate to support NASA's information architecture
- **Step 3** - Convert NASA geospatial data into the SDS format according to NASA-established priorities.

Step 1 – Correlate NASA Investment Categories with the SDS

- Building a relationship between NASA's investment categories and the spatial data standard entity classes ties the tabular data to the geospatial data for incorporation into a common operational picture
- This correlation further establishes the foundation needed for geospatial tracking of asset status, cost and other information on NASA real property

Step 2 – NASA Facilities SDS Gap Analysis

- Use of the Standards depends on its adequacy for NASA's particular business concerns
- Review of NASA's data requirements against the SDS/FM standard to identify any "gaps" that would prevent NASA from effectively using the Center's standard information model
- NASA input would enhance the Standards and support better data sharing

Step 3 – NASA Data Conversion Effort

- Implement existing NASA data into a database that follows the SDS structure
- Identify data required by the SDS but not yet gathered by NASA
- Collect and incorporate required data
- Include keys that tie to financial databases to allow visual cost accounting on the common operational map

The Navy's ICBM provides an additional structure for cost accounting

- The Navy's Installation Core Business Model (ICBM) provides a business oriented view of activities in all areas of an operation for accurate cost allocation
- The ICBM subfunctions are tied to the SDS for data sharing
- The ICBM approach benefits the entire Navy
 - Streamlined cost collection
 - Accurate and consistent data reporting
 - Identification of the real cost of doing business

NASA's cost collection structure can be similarly correlated to the SDS

- Consistent cost accounting by business area
- Costs collected by business areas to ensure accurate representation of business expenses
- Normalized geospatial information using the SDS/FMS model allows data sharing across NASA sites

Conclusion

- NASA is moving towards a common operational picture
- The SDS is essential for accuracy and consistency in that common picture
- The SDS allows for efficient data sharing and cost savings
- An SDS-compliant system can be implemented at NASA's pace according to NASA priorities
